                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PRIOR APPLICATION NUMBER: US 60/099,801
PRIOR FILING DATE: 1998-09-10
NUMBER OF SEQ ID NOS: 17
SEQ ID NO 16
LENGTH: 9
TYPE: PRT
OTHER INFORMATION: Amino acid sequence of a RGD peptide incorporated
OTHER INFORMATION: into the region of the fiber gene within the HI loop.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               GENERAL INFORMATION:

Patent No. US20020103130A1

GENERAL INFORMATION:

APPLICANT: Rucellaht, Erki

APPLICANT: Rucellaht, Erki

TITE OF INVENTION: No. US20020103130A1e1 Integrin-Binding Peptides

CORRESPONDENCE ADDRESS:

ADDRESSEE: Campbell & Flores LLP

STREET: 4370 La Jolla Village Drive, Suite 700

STATE: California

COUNTRY: USA

ITE: OS 122

COMPUTER READALLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/WS-DOS

SOFTWARE: Patentin Release #1.0, Version #1.25

APPLICATION NUMBER: US/09/364,597A

CLASSTFICATION DATA:

APPLICATION NUMBER: US 08/158,001

FILING DATE: 30-JUL-1999

CLASSTFICATION DATE: US 08/286,861

FILING APPLICATION DATA:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to reagents (A) for preparing thrombus imaging agents comprising specific binding peptides (I) and a technetium-99m binding group (II) covalently attached to the specific binding peptide. (I) is a ligand for the GPIID/IIIa receptor and can be a cyclic or linear peptide not containing the Arg-Gly-Asp (RGD) sequence. (I) are specific for thrombi, and are small and therefore are rapidly cleared from blood and background tissue. (A) are used to produce scintigraphic imaging agents for detection of thrombi in vivo. The present sequence is one such TC-99m labelled peptide.

                                                                    This sequence represents a peptide ligand for the fibrin polymerisation site. The invention relates to a complex (A) for thrombus imaging comprises technetium-99m (Tc-99m) completed with a reagent comprising a peptide (P) with 4 to 100 amino acids sequence and a Tc-99m binding moiety covalently bound to (P). (P) is selected from a linear peptide ligand for a GPIIb/IIIa receptor not comprising the amino acid sequence (arginine-glycine-aspartate), a peptide ligand for a polymerisation site of fibrin, and a cyclic peptide ligand for the GPIIb/IIIa receptor. The thrombus imaging reagents provided by the present invention can be used for visualising thrombi in a mammalian body when Tc-99m is labelled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to new thrombolytic agents which comprise a capable of specifically binding to a component of a thrombolytic proteinase covalently linked to a targetting compound thrombolytic agents can be used for eliminating thrombi in vivo in, myocardial infarction, cerebral ischaemia, deep vein thrombosis or pulmonary embolism. A labelled form of the thrombolytic agent can also be used to image thrombi for diagnostic purposes. The thrombolytic agents are specifically targetted to thrombus sites in vivo and have minimal hamaorrhagic side effects and side effects related to non specific proteclysis. The present sequence represents a specifically claimed targetting peptide. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reagent useful for preparing thrombus imaging agent - comprises peptide covalently linked to technetium binding moiety which is technetium labelled and binds to thrombus component.
                                                                                                New thrombolytic agents - comprise thrombolytic proteinase covalently linked to targetting compound for binding to component of thrombus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Technetium-99M label; thrombus imaging; GPIIb/IIIA receptor; ligand;

The invention relates to peptides having specific binding specificity for fibronectin-binding and vitronectin-binding integrins, and in particular for alphasberal integrin. The peptides can be used in a method of preventing integrin-mediated attachment to an extracellular matrix protein, fibronectin, or vitronectin which comprises (a) contacting the cells with a soluble peptide selected from the sequences shown in AAY21561, AAY21563 and AAY21586; or (b) contacting the sequence shown in AAY21561, and alpha the sequence -NGR- selected from the sequences soluble peptide comprising the sequence -NGR- selected from the sequences contacting with a soluble peptide shown in AAY21571. The peptides are useful for inhibiting metastatic process with which fibronectin adhesion is associated and also for inhibiting alpha v beta 1-mediated cell attachment to fibronectin, are also useful for promoting attachment to vitronectin. The peptides are also useful for promoting attachment to fibronectin. The peptides are also useful for promoting attachment to fibronectin.
                                                                                                                                                                                                                                                                                                  ö
                             The invention relates to a reagent for preparing a thrombus imaging agent. It comparises: (a) a specific binding peptide (BP) having a sequence of 4-100 manio acids; and (b) a technetium-99m binding moiety (TBM) covalently linked to the peptide which binds to a component of a thrombus. TBM forms an electrically neutral complex with technetium-99m. The small size of the peptide component of the reagent enhances blood and background tissue clearance and it is easy to prepare. This sequence represents a GPID/IIIa receptor binding peptide covalently linked to a

The present sequence represents a synthetic peptide which acts as an antendral antendral between the invention provides various antendral because they mimic extra-cellular matrix ligands or other cell adhesion ligands that bind to receptors such as integrin receptors, including fibronectin. Immin. LFA-1, MAC-1, p150, 95, vitronectin and gplib/lira receptors. Some of the peptides contain the amino acid sequence Arg-Gly-Asp (RGD). Others contain non-RGD sequences, for e.g RCD sequences, and reverse cuseful in modulating cell adhesion, including adhesion related to fibronectin, as well as leukocyte adhesion to endothelial cells. They are also claimed to be useful in the study, diagnosis, treatment or prevention of diseases which relate to cell adhesion, e.g. adult respiratory distress syndrome (ARDS), thrombosis and inflammatory conditions
                                                                                                                                                                                                                                                                                  New cyclic peptide(8) and peptidomimetic compounds - are integrin receptor antagonists useful in modulating cell adhesion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Targetting peptide #45 useful as component of thrombolytic agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombolytic agent; thrombolytic proteinase; blood clot; fibrin; thrombus; antithrombotic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      / Match 100.0%; Score 35; DB 2; Length 5; Local Similarity 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides AAW03483-508 are examples of synthetic peptides generated to bind to the fibronectin/vitronectin-binding integrin alpha(5)beta(1). They are synthesised to contain the alpha(5)beta(1)-integrin peptide binding motifs: DGR, NGR or RGD. The peptides interfere with the binding of fibronectin and vitronectin to this integrin and thus may be used to block integrin-mediated cell adhesion to extracellular matrix proteins, esp. to inhibit tumour metastasis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to reagents for scintigraphic imaging of a thrombus in-vivo, comprising (A) a specific binding compound capable of binding to at least one component of a thrombus, covalently linked to (B) a technetium-99m-binding moiety. Specific peptides constituting the reagents are claimed as new. The present peptide is one such peptide. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                       The peptide sequence is an example of a highly generic sequence contg. the RGD motif. Compounds contg. these lipid peptides are useful as cell migration inhibitors in cell adhesion membranes or cell culture bodies. See also AAR29048-54

The sequences given in AAR76185-200 and AAR79073-94 are high affinity integrin binding peptides which bind to various integrins. Peptides which bind to alphas/betal integrins contain the motifs given in AAR76185-86 and peptides which bind to alphas/beta5 and alphas/beta3 integrins are also contain the motif given in AAR76187. Alphav/beta5 integrins are also contain the motif given in AAR76187. Alphav/beta5 integrins are also conformationally stabilised configuration which is due to the formation of a disulphide bond, a peptides of a dactam bond. These peptides may be used for isolating the complementary integrin from a sample mixture by contacting them under ionic conditions to allow binding of the integrin to the peptide and then separating the integrin from the peptide and then separating the integrin from the peptide. They can be used for attaching cells to a substrate, by binding them to the substrate with the cell. The peptides promote wound healing when applied locally and inhibit the attachment of osteoclasts to bone. They inhibit angiogenesis, metastasis of tumours and migration of smooth muscle cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            High affinity integrin binding peptides - can be used to attach cells to a substrate, inhibit the attachment of osteoclasts to bone, promote wound healing, inhibit angiogenesis, metastasis of tumours and migration of smooth muscle cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

cell culture body.

```
To residue homoCys1 is attached Acetyl and to residue Cys5 is attached

NH2. The peptide is prepd. using standard methods of solid phase

the synthesis and is one of 17 pref. examples of a highly generic formula.

The peptide is used to inhibit fibrinosen-induced platelet aggregation

and is partic. useful because it does not significantly deplete the

platelet count. It has a relatively short duration of activity and is

thus useful where prevention of platelet aggregation over a short period

of time is desirable, e.g. in surgery of peripheral arteries and

cardiovascular surgery. It is also useful in prevention of platelet

thrombosis, thromboembolism and reocclusion either during and after

thrombolytic therapy, or after angioplasty of coronary and other arteries

thrombolytic therapy, or after angioplasty of coronary and other arteries

chrombolytic therapy, or after angioplasty of coronary and other arteries

thrombolytic therapy, or after of thrombolytic agents, e.g. plasminogen

activators or streptokinase, or anticoagulants. See also AAR10413-18 and

The peptide is prepd. using standard methods of solid phase synthesis and is one of 17 pref. examples of a highly generic formula. The peptide is used to inhibit fibrinogen-induced platelet aggregation and is partic. useful because it does not significantly deplete the platelet count. It has a relatively short duration of activity and is thus useful where prevention of platelet aggregation over a short period of time is desirable, e.g. in surgery of peripheral arteries and cardiovascular surgery. It is also useful in prevention of platelet thrombosis, thromboembolism and reocclusion either during and after thrombolytic therapy, or after angioplasty of coronary and other arteries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and after coronary artery by-pass procedures, or to prevent myocardial infarction. It may be combined with thrombolytic agents, e.g. plasminogen activators or streptokinase, or anticoagulants. See also AAR10413-18 and EP-410537, EP-410539, EP-410540, EP-410541, and EP-410767

To residue Cys5 is attached OH. The peptide is prepd. using standard methods of solid phase synthesis and is one of 17 pref. examples of a highly generic formula. The peptide is used to inhibit fibrinogen-induced platelet aggregation and is partic. useful because it does not significantly deplete the platelet count. It has a relatively short duration of activity and is thus useful where prevention of platelet enggragation over a short period of time is desirable. e.g. in surgery periodical arteries and cardiovascular surgery. It is also useful in prevention of platelet thrombosis; thromboembolism and reocclusion either during and after thrombolytic therapy, or after angioplasty of coronary and other arteries and after coronary artery by-pass procedures, or to prevent myocardial infarction. It may be combined with thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     agents, e.g. plasminogen activators or streptokinase, or anticoagulants. Cys at position 1 carrries an acetyl group. The peptide inhibits binding of fibrinogen to the platelet membrane glycoprotein complex IIb/IIIa receptor. It may be used to prevent post-operative thromboesis, thromboembolism and reocclusion, platelet adhesion in extracorporeal blood circulation systems and to prevent myocardial infarction. "Nucleotide sequence of the genome region encoding the 26S mRNA of eastern equine encephalomyelitis virus and the deduced amino acid sequence of the viral structural proteins.";

J. Gen. Virol. 68:2129-2142[1987).

-!- FUNCTION: THE CAPSID PROTEIN IS AN AUTO-PROTEASE.

-!- PINTS Specific enzymatic cleavages in vivo yield mature proteins.

-!- MISCELLANEOUS: THE 6 kDs POLYPEPTIDE PROBABLY SERVES AS THE SIGNAL.

SEQUENCE FOR THE MEMBRANE GLYCOPROTEIN B1, WHICH IS THE VIRAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     01-MG-1992 (Rel. 23, Created)

                                                                                                                               SUBUNIT: Monomer.
SUBCELLULAR LOCATION: Secreted.
TISSUE SPECIFICITY: Abundant in liver and serum with smaller amounts found in the stomach and kidney.
DOMAIN: Composed of two homologous domains.
SIMILARITY: Belongs to the transferrin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (GLCNAC. .) Mar. Biol Tendenhol. 5:225-229(1996).

-I. FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH CAN BIND TWO ATOMS OF PERRIC IRON IN ASSOCIATION WITH THE BINDING OF AN ANION, USUMLLY BICARBONATE.

-I. SUBUNIT: Monomer (By similarity).
-I. SUBCELMULAR LOCATION: Secreted.
-I. DOMAIN: Composed of two homologous domains.
-I. SIMILARITY: Belongs to the transferrin family.

DEVELOPMENTAL STAGE: WHEN THE FOOD/PHEROMONE RATIO IS HIGH, ITS
LEVEL PERKS DURING THE L1 LARVAL STAGE. EXPRESSION IS DETECTED IN
LARVAE BEGINNING 4 TO 5 HOURS AFTER HATCHING, THROUGH THE FOUR
LARVAE STAGES, AND IN ADULTS.
INDUCTION: Dauge-1-inducing pheromone inhibits its expression and
promotes dauger formation, whereas food reactivates its expression
and promotes recovery from the dauger state.
SIMILARITY: Belongs to the TGF-beta family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          15-JUL-1998 (Rel. 36, Created)

genome polyprotein - eastern equine encephalomyelitis virus
N;Contains: 6K protein; capsid protein C; envelope protein E1; envelope protein E2; envel
C;Species: eastern equine encephalomyelitis virus
C;Date: 06-Jan-1994 #sequence_revision 01-Nov-1996 #text_change 26-Aug-1999
C;Accession: S26373
R;Volchkov, V.E.; Volchkova, V.A.; Netesov, S.V.
Mol. Gen. Mikrobiol. Virusol. 5, 8-15, 1991
A;Fitle: Complete nucleotide sequence of the eastern equine encephalomyelitis virus genom A;Reference number: S26369; MUID:91375524; PMID:1896061
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gructural polyprotein - eastern equine encephalomyelitis virus
N;Contains: 6K protein; capsid protein; El protein; E2 potein; E3 protein
C;Species: eastern equine encephalomyelitis virus
C;Species: eastern equine encephalomyelitis virus
C;Accession: 0.4 May-1998 #sequence_revision 15-May-1998 #text_change 26-Aug-1999
C;Accession: S72350
